

# Fleet Monitoring Concept and New Statistical Evaluation Methods Supplement for interested

F.J. LEGERER, M. Kasper, P. Nöthiger, F. Schmid

Time-Series Project Proposal for VERT-2016  
Zeitreihen-Statistik VERT-Forum 18.03.16

# Supplement for interested Organisational How should it work?

Fleet manager's window exhibits

vehicles marked green or yellow or red

yellow (caution) - red (failure, immediate action)

Next window:

vehicle no; logger no; failure type; rec.proceed

# VERT-FORUM: Fleet Monitoring Concept, Statistical Evaluation Methods

F. LEGERER, M. KASPER, P.NÖTHIGER, F.SCHMID

## Organisational

Nöthiger's task:

Logger system check:

Voltage? Data-transfer? Signal/noise? Electronic-system? Computational function?

Sensor check:

Pressure? Temperature? Rpm? GPS? Lambda?

NOx-sensor?

# VERT-FORUM: Fleet Monitoring Concept, Statistical Evaluation Methods

F. LEGERER, M. KASPER, P.NÖTHIGER, F.SCHMID

## Organisational

Legerer - (Schmid programming):

Present checks of malfunctions

plus

extension into prediction

Present checks: 4 categories

F-substrate; regeneration; engine; lubrication

# VERT-FORUM: Fleet Monitoring Concept, Statistical Evaluation Methods

F. LEGERER, M. KASPER, P.NÖTHIGER, F.SCHMID

L.C. Larsen:

*"It's no so easy to design a DPF with good regeneration"*

## Present checks

- How do we conceive a DPF's operation? -  
Without any desire to challenge present concepts,  
however, we should avoid complacency

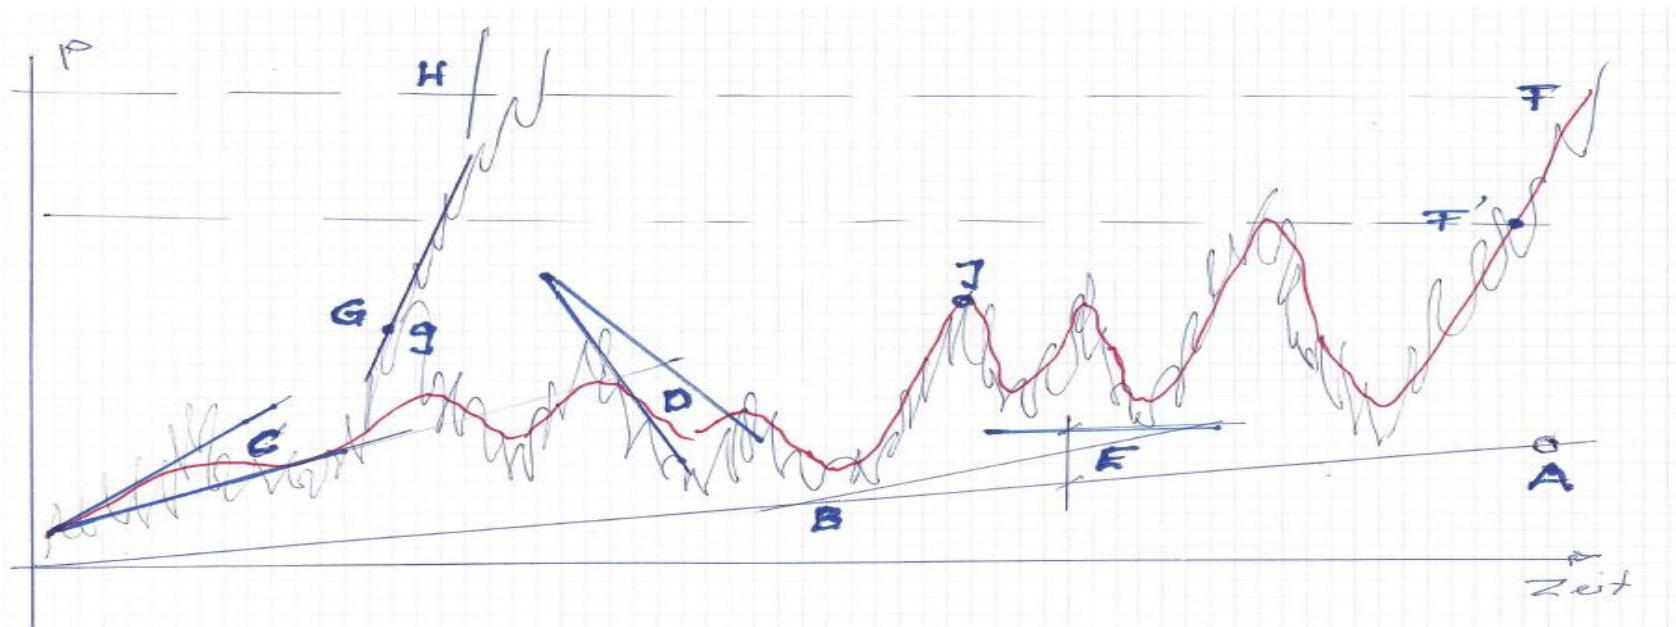

# VERT-FORUM: Fleet Monitoring Concept, Statistical Evaluation Methods

F. LEGERER, M. KASPER, P.NÖTHIGER, F.SCHMID

Present checks, our imagination (scheme Dr A.Mayer)

x

# VERT-FORUM: Fleet Monitoring Concept, Statistical Evaluation Methods

F. LEGERER, M. KASPER, P.NÖTHIGER, F.SCHMID

---

Mayer's watchlist and how to quantify:

Back-pressure too high => definition (alarms:yellow and red DPF cleansing F', F

Back-pressure too low (trend falling) => leak in substrate PN control early detection enables repair at low cost

Gradient of back pressure accelerated: Engine or regeneration (C)

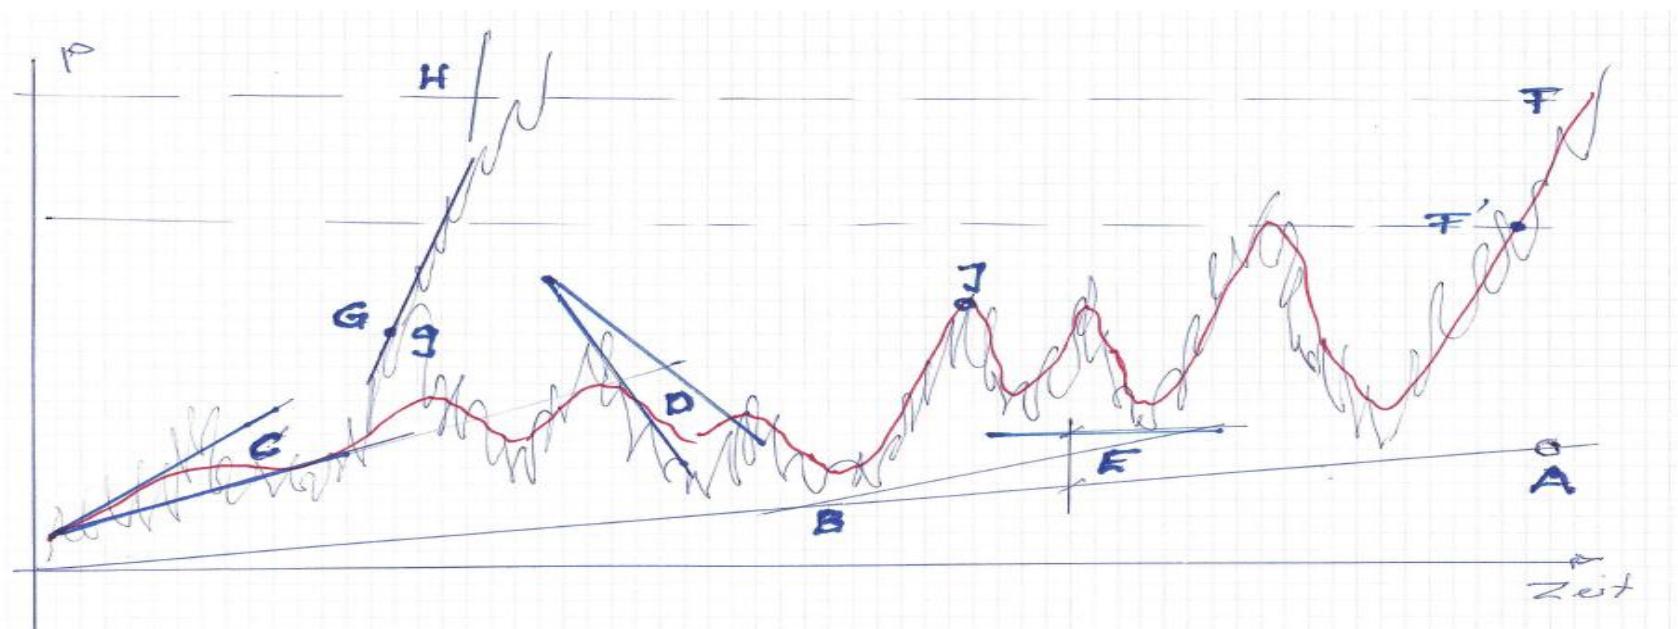

Soot load rapidly andprogresively increasing - How to quantify (curvature?) => early alarm (G, H)

Prediction of ash cleansing [operating hours] A

Gradient of ash load increasing => engine oil, engine ?

## Regenerating

## Regeneratingsystem

Gradient of pressure decrease (slope) (D) „too flat“ =>  
FBC lacking, check with temperature profile; check DOC interval  
of peaks increasing (J)

Base pressure after regeneration is too high (E); end of  
regeneration too soon (E)

## Engine:

Increased soot production (C, G) combined with increased ash (B)

Exhaust-temperature increasing, peaks  $t > 600 \text{ }^{\circ}\text{C}$

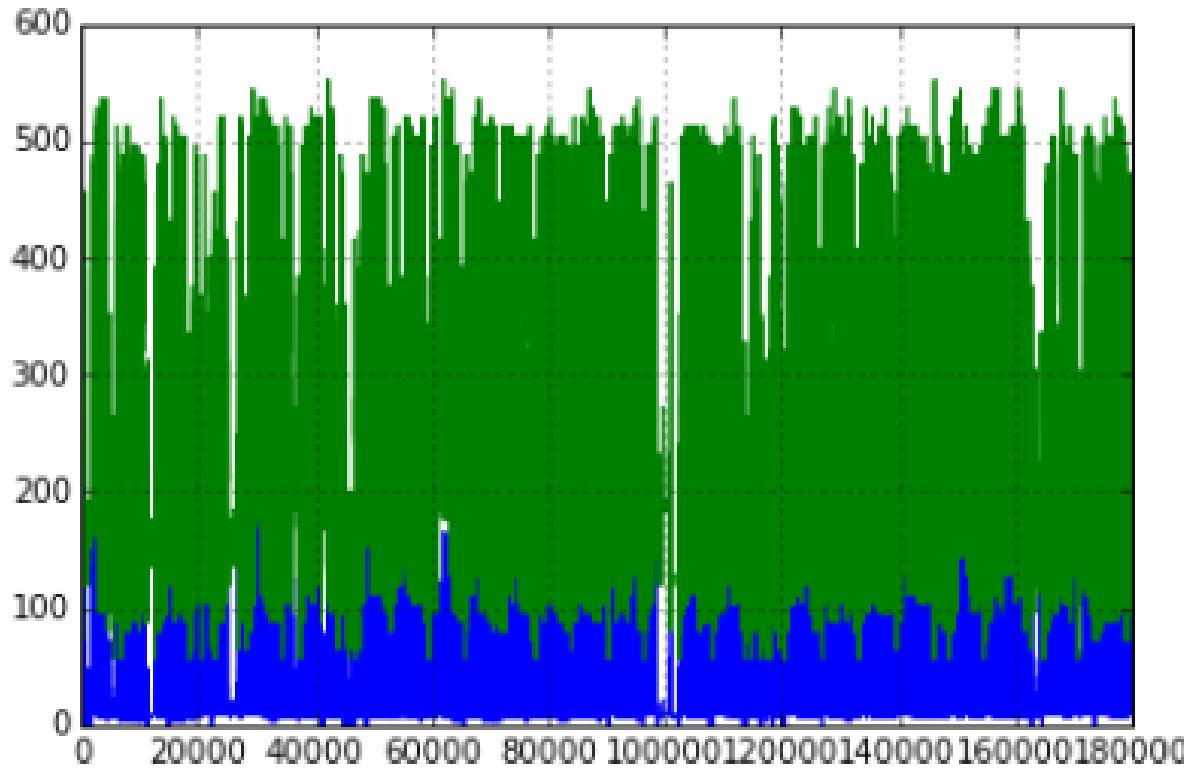

Lubrication: Trend in prediction of cleansing

Exploration of mystery effects

How to quantify heuristic considerations?

At present: one particular realisation of a stochastic process

## Notation

At present moments:

- mean (=average)
- standard deviation (= square root of variance or mean square =  $M_2$ )
- 3<sup>rd</sup>order moment  $M_3$  (obviously useful for type of data)

How to go about quantification of heuristic considerations:

Splitting, 1.attempt

180'000 hrs divided into 10 blocks à 18'000 hrs;  
measurements, 10 sec each lumped to 5 min. (=30)

Reason: Fundamentals of Probability Theory .....

- bounds for real values of measured quantity

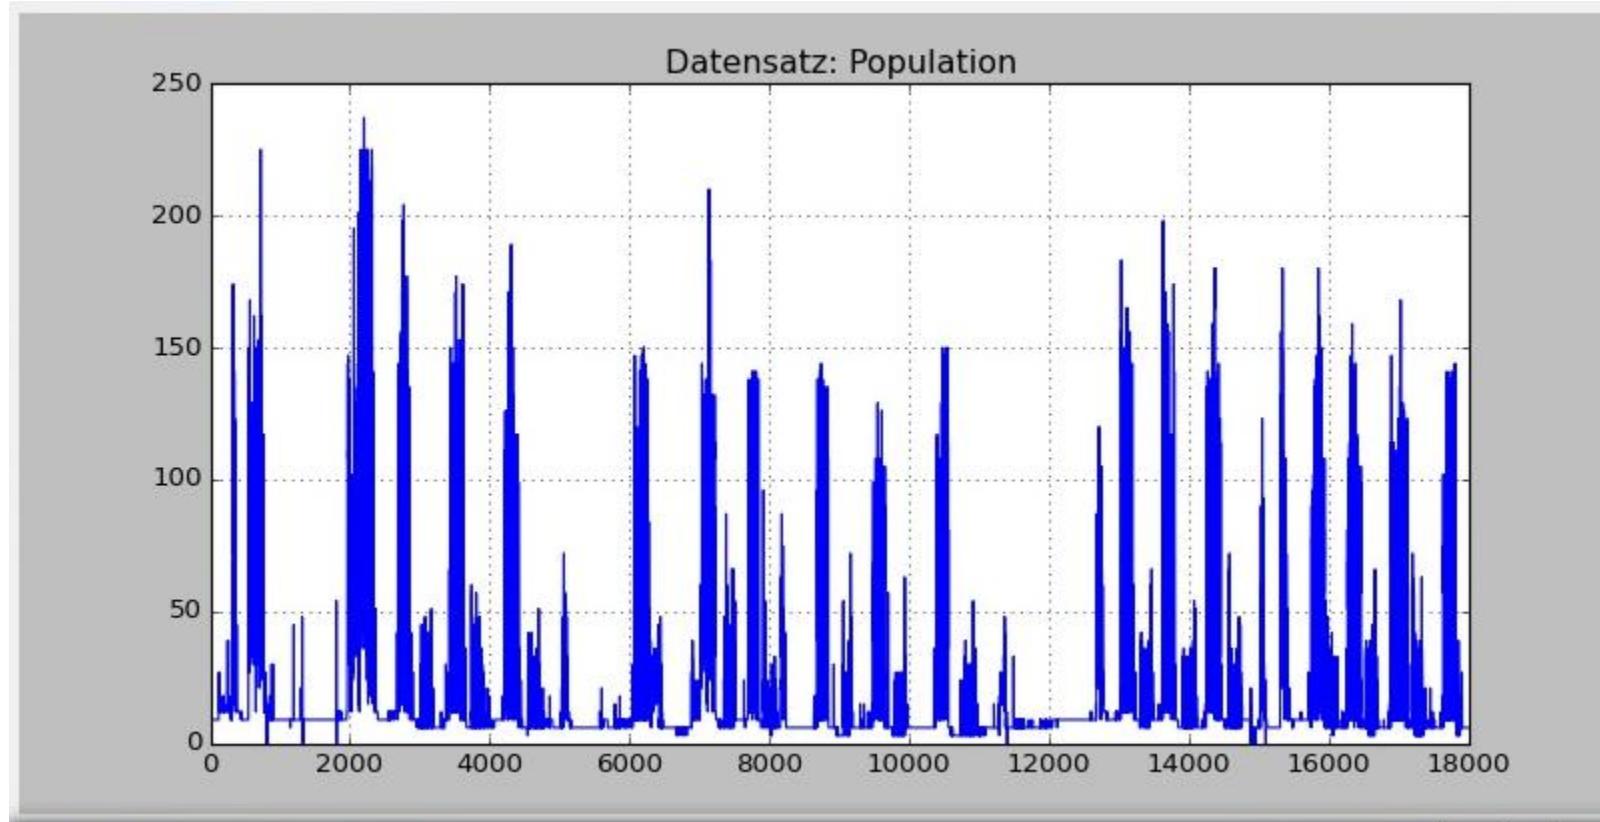

## Further notations

- Covariance function
- Auto -CF (= extension to a mean square of a lag)
- Cross -CF (= mean square of a cross product)
- **Correlation functions:** same for standardised data,
- (auto-correlation, cross correlation)
- our choice: Poisson -distributed
- Correlation functions of higher order =  
Wehrmann' s extension (= scientific part)

## How to go about?

### Classic difference methods, 1<sup>st</sup> and 2<sup>nd</sup> differences

$$\Delta x = (x_t - x_{t-1}); \quad \Delta x / \Delta t = (x_t - x_{t-1}) / \Delta t; \text{ and} \quad \Delta^2 x / \Delta t^2$$

for trend analyses

intervall length decisive

long: for base line (ash)

short: slow falling - after reg.

slow falling reg. op. substrate defect

check crosscorr. Temp

second derivative: curvature: lube oil

2<sup>nd</sup> derivative: beyond classic m.

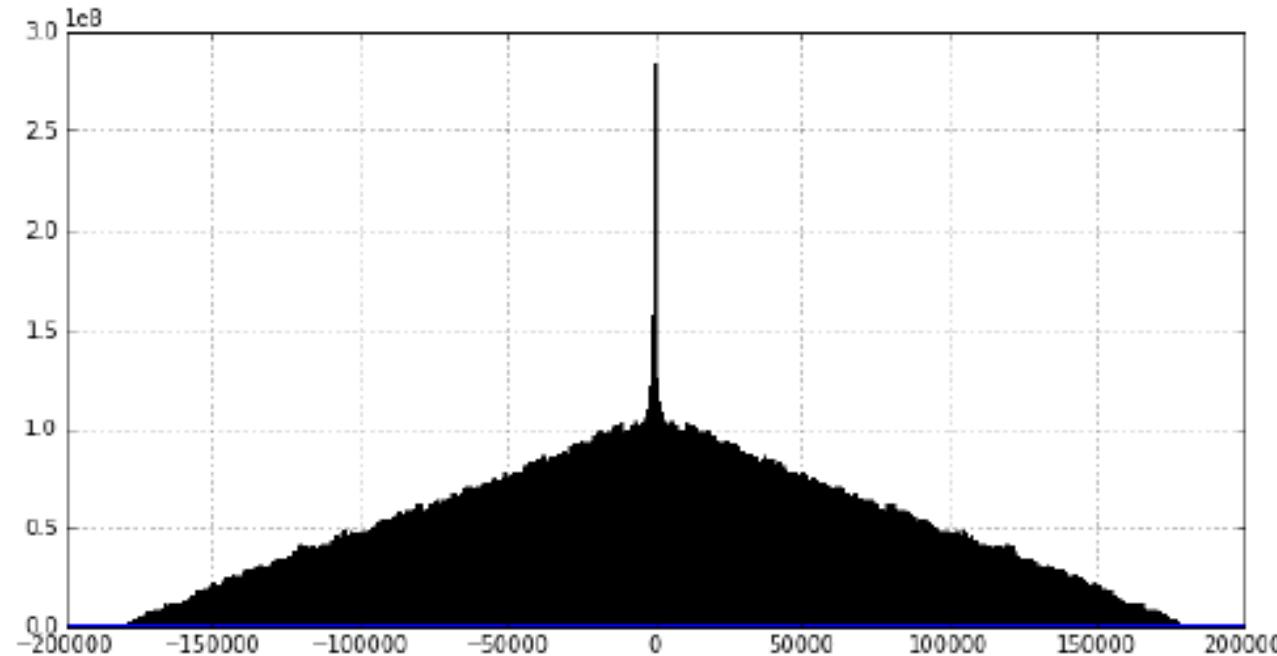

# VERT-FORUM: Fleet Monitoring Concept, Statistical Evaluation Methods

F. LEGERER, M. KASPER, P. NÖTHIGER, F. SCHMID

Druck

W1, N > "Mittelwert + (2\*Streuung)" 11,319

Autocorrelation 1:

Attempt - failure, two possible reasons:

- Transformation - standardisation according Poisson
- Too many irregularities of regeneration

First standardisation to be re-checked

Second, by means of higher order cross - correlation a periodicity of regeneration-peaks to be defined  
(scientific problem)

„mean-periodicity“ a necessity for analysis

# VERT-FORUM: Fleet Monitoring Concept, Statistical Evaluation Methods

F. LEGERER, M. KASPER, P. NÖTHIGER, F. SCHMID

---

Expected time frame:

Classical methods: June 2016

Higher order methods: Sept. 2016

Analyses of selected filters:

depending on interest: later on, all over  
next year (i.e. 2017)
